

Final Lab - EPAW

GOAL: Apply all the knowledge you have acquired during the subject.

REQUIREMENTS

- Your web must use Java Web Servlets and SQL in the backend.
- Your web must use JavaScript and AJAX in the frontend.
- Your web must be structured using <div> elements and CSS (or an equivalent approach).
- Your web must be organized using the Model View Controller (MVC).

In the final lab, you must implement your own X (Twitter) by following the work you have previously done along the subject. To pass the subject, we have defined the following mandatory components that your site has to accomplish:

- System must contemplate three types of users:
 - Anonymous.
 - Registered.
 - Administrators.
- Anonymous users should be able to view:
 - Global timeline which shows either the latest or most popular posts.
 - Personal pages of registered users, which shows the public information and posts of a particular user.
- Registered users should also be able to view:
 - Their profile, where they can view and edit their own information (e.g. Name, username, profile picture etc.),
 - Personalized timeline which shows posts only from the users they follow.
 - Each user can publish posts, edit and delete them.
 - Users can follow/unfollow other users.
 - There should be a mechanism for new users to find and follow other registered users. This could be a “who to follow” page showing a list of registered users or they can find users from the *global timeline* of popular posts. You might also implement a search mechanism for this.
 - You should create a view where all the followed users are listed to access their public personal page or unfollow them.
- An admin user can edit/delete:
 - User accounts.
 - Personal pages, profiles and posts.

If your web meets above requirements you will obtain 6 points over 10. We provide a set of “extra” tasks. Each of them will raise your grade 1 point up to 9:

- Tweets can be commented/replied.
- Option to like/dislike a concrete tweet (also the comments if it's the case).
- Upload and use images.

You can also propose your own extra features, but they must be approved by me.

The last point will evaluate the final report. The report must describe the functionality of your project and explain technical details using the diagrams and resources worked along the subject.

- Sequence diagrams.
- Use case diagram.
- Class and Entity/Relation diagrams.
- MVC diagram.
- Layout and CSS structure implementation details.

SUBMISSION:

- PDF with the final report.
- WAR file with the Java sources included.
- Dump of the DB.
- README file with deployment (how to install properly) instructions.

IMPORTANT: reports of more than 10 pages will not be evaluated.

DEMO:

Final exam will consist of the demo of your site **where each member MUST be present**. After going through all the functionalities of your site, each member will be questioned on random functionalities and be graded accordingly.
